

1. GetSibu — Creative Asset Management Platform

GetSibu is an intelligent creative asset management platform designed to help teams store, organise, search, review and collaborate on videos, images, documents and audio from one central workspace. Instead of depending on scattered folders, disconnected drives and complicated naming systems, GetSibu creates a searchable creative library where teams can quickly locate the right asset and understand its context.

2. The Operating System for Creative Libraries

GetSibu acts as an operating system for modern creative libraries by bringing storage, organisation, AI tagging, search, collaboration, permissions and analytics into one platform. Creative teams can connect existing storage sources, import assets, automatically process media and make the resulting library available to authorised team members.

3. AI-Powered Digital Asset Management

GetSibu combines digital asset management with artificial intelligence to make large creative libraries easier to understand. AI-assisted tagging, scene detection, OCR, semantic search, face grouping and duplicate detection help teams organise information that would otherwise require extensive manual work.

4. Creative Library Management

A growing creative team can quickly accumulate thousands of videos, images, documents and audio files. GetSibu provides a structured environment where those assets can be organised through folders, tags, collections, metadata and permissions, creating a reliable source of truth for the entire organisation.

5. Intelligent Media Library

GetSibu transforms a conventional media library into an intelligent information system. Instead of searching only by filenames, users can search using descriptions, visual characteristics, extracted text, tags, people, colours, scenes, formats and other available metadata.

6. Centralised Creative Asset Library

GetSibu provides one central location for creative assets from connected drives, local infrastructure and direct uploads. By bringing assets together, teams can reduce the confusion caused by multiple storage locations and disconnected versions of the same file.

7. Modern Digital Asset Management

Traditional file storage focuses primarily on keeping files available. GetSibu extends that concept by adding AI-assisted organisation, contextual search, collaboration, approvals, version history, analytics and permission controls specifically designed for creative workflows.

8. Creative Asset Organisation

GetSibu helps teams organise creative assets using structured folders and scalable taxonomies. Hierarchical tags, synonyms, colours and inheritance make it possible to create an organisation system that remains useful even when the library grows to thousands or millions of assets.

9. AI-Aware Asset Management

AI-aware asset management allows GetSibu to analyse media and recommend meaningful tags and classifications. Teams can approve AI suggestions in bulk, override them when necessary and maintain control over how their library is organised.

10. One Source of Truth for Creative Teams

GetSibu gives creative, marketing, production and brand teams a shared source of truth for their digital assets. Everyone works from the same organised library, while permissions and approval workflows help ensure that users access and distribute the right content.

11–30. Core Product Pages

11. Creative Asset Search

GetSibu makes creative assets searchable through filenames, metadata, OCR, AI-generated tags, comments and semantic information. Users can search for a specific asset or describe what they need in natural language and let the platform interpret the request.

12. AI Asset Discovery

AI asset discovery helps users find files based on what appears inside the asset rather than depending entirely on manually entered metadata. This is particularly useful when teams have large libraries containing thousands of visually similar files.

13. Media Search Platform

GetSibu provides a dedicated search experience for creative media. Users can combine keywords and filters related to file category, format, uploader, resolution, date and other available information to narrow large result sets quickly.

14. Semantic Creative Search

Semantic search allows users to describe the type of asset they want using natural language. A request such as “warm urban evening footage” can be interpreted according to available embeddings and AI-generated media information rather than relying only on exact keyword matching.

15. OCR-Powered Asset Search

GetSibu extracts text from images, PDFs, presentations and screenshots so that the content becomes searchable. This allows users to locate documents and visual assets even when the required information exists inside the file rather than its filename.

16. Search Across Creative Libraries

Teams can search across their entire creative library rather than manually opening folders one at a time. Search results can combine different information sources to make asset discovery faster and more flexible.

17. Saved Asset Searches

Frequently used searches can be saved and shared through a URL. This makes it easier for teams to create reusable views for campaigns, clients, products, content categories and other recurring workflows.

18. Natural Language Asset Search

Natural language search lets users describe assets in the way they naturally remember them. Users do not have to know the exact filename if they remember characteristics such as colour, scene, subject, location or campaign context.

19. Advanced Media Filters

GetSibu provides filters that can narrow results according to categories, formats, sources, resolutions and dates. Filters can be combined to progressively reduce a large library into a relevant collection of assets.

20. Fast Asset Discovery

GetSibu is designed around fast asset discovery, including sub-second search performance across large libraries. The platform combines search indexing, metadata and AI-assisted retrieval to reduce the time spent looking for files.

21. Creative Asset Indexing

When assets enter GetSibu, the platform processes available metadata and prepares them for search and organisation. This creates an indexed representation of the library that can support faster discovery.

22. Media Metadata Management

Metadata such as EXIF, XMP, file paths, creators and custom keywords can become part of the asset record. This helps preserve context and improves the usefulness of a migrated or newly created library.

23. Asset Metadata Search

Users can search available metadata alongside tags and extracted content. This gives creative teams multiple ways to find an asset when the original filename or folder structure is unknown.

24. Creative File Discovery

GetSibu helps teams discover images, video, audio and documents through a unified search experience. The platform is designed to reduce the dependency on folder knowledge and individual team members remembering where files were stored.

25. Searchable Video Library

Videos can be indexed and enriched with AI-generated information so that users can discover relevant footage without manually reviewing every file.

26. Searchable Image Library

Images become searchable through metadata, tags, visual characteristics and extracted information. This makes large collections easier to reuse across campaigns and projects.

27. Searchable Document Library

Documents can be indexed using extracted text, metadata and organisational tags. Users can locate important documents without manually opening every PDF or presentation.

28. Searchable Audio Library

Audio assets can be managed alongside other creative formats, allowing teams to maintain a central media environment instead of separating audio from the rest of their creative library.

29. Creative Library Navigation

GetSibu provides structured navigation through library views, folders, tags, collections and search. Users can move between broad library exploration and highly specific asset discovery.

30. Asset Discovery Workflow

The asset discovery workflow begins with a search, continues through filtering and previewing, and ends with the user locating the correct asset. Saved searches and AI-assisted discovery make recurring searches easier to repeat.

31–60. AI Features

31. AI-Assisted Tagging

GetSibu can suggest tags during asset processing so that teams do not have to manually classify every file. Suggested tags can be reviewed, approved or overridden by authorised users.

32. AI Vision Analysis

AI vision capabilities analyse visual media and identify objects, scenes, moods and colours. These observations can become searchable library data.

33. AI Scene Detection

Scene detection automatically breaks video into structured scenes. Users can navigate between important sections of a video instead of repeatedly scrubbing through the entire file.

34. AI Object Detection

GetSibu can identify objects appearing in supported media and associate them with confidence information. These tags can later contribute to asset search and discovery.

35. AI Mood Detection

AI analysis can identify visual mood characteristics and make them available as searchable information. This helps teams find creative material according to an intended visual feeling.

36. AI Colour Detection

Colour information can be extracted from visual assets and used as part of asset discovery. Users can search for visual content based on colour characteristics when appropriate.

37. AI Face Grouping

Face grouping clusters people across a creative library. Teams can use this capability to locate multiple assets featuring the same founder, talent, client or other recognised person.

38. AI OCR

OCR extracts text from images, documents, presentations and screenshots. Once processed, the extracted text becomes part of the searchable asset information.

39. AI Semantic Search

Semantic search interprets meaning rather than relying exclusively on exact words. This allows users to search for creative concepts and visual descriptions.

40. AI Duplicate Detection

Duplicate detection combines exact and perceptual hashing to identify identical files and visually equivalent copies, including cases where a file has been re-encoded or renamed.

41. AI Auto Collections

GetSibu can propose collections based on patterns it identifies across the library. Users can approve these suggestions and use them to create more organised asset groupings.

42. AI Asset Classification

AI classification helps categorise assets according to their content and available metadata. This reduces repetitive manual organisation work.

43. AI Media Understanding

AI media understanding allows GetSibu to interpret the content of visual assets and make that information available through search and organisation workflows.

44. AI Creative Intelligence

Creative intelligence transforms stored files into a more understandable information layer. Instead of treating every asset as an anonymous file, GetSibu can attach searchable meaning to the content.

45. AI-Powered Asset Management

AI-powered asset management combines automated analysis with human approval. Teams retain control while using AI to reduce the amount of repetitive library administration.

46. AI Tag Confidence

AI-generated tags can include confidence information that helps users understand how strongly the system associates a tag with an asset.

47. AI Tag Approval

Teams can approve suggested tags in bulk, making large-scale asset organisation significantly faster than reviewing every file individually.

48. AI Tag Override

AI recommendations are not permanent. Authorised users can override tags whenever the automatically generated classification does not match the team's intended taxonomy.

49. AI Creative Search

AI creative search allows users to describe the asset they want and receive relevant results based on available semantic and visual information.

50. AI Media Indexing

AI media indexing prepares creative content for intelligent discovery by processing supported visual, textual and metadata signals.

51. AI-Powered Video Discovery

AI video discovery allows users to search video collections using scenes, objects, visual characteristics and other indexed information.

52. AI-Powered Image Discovery

AI image discovery helps teams locate photographs, product shots, campaign images and other visual content through AI-generated metadata.

53. AI Document Discovery

AI document discovery combines OCR and metadata to help users locate documents based on information contained inside them.

54. AI Creative Workflow

AI features become part of the asset workflow from ingestion through organisation and discovery. This means AI is not presented as an isolated feature but as an operational layer across the library.

55. AI Media Automation

AI automation reduces repetitive tasks such as tagging, scene identification, OCR extraction and collection creation.

56. AI Asset Recommendations

GetSibu can use information discovered across the library to recommend relevant collections and organisational structures.

57. AI Library Organisation

AI-assisted organisation helps teams maintain order as the library grows rather than requiring a major manual cleanup after every campaign.

58. AI Asset Intelligence

Asset intelligence combines AI analysis with metadata and search capabilities to make media libraries more informative.

59. AI Creative Operations

AI creative operations help production and marketing teams spend less time managing files and more time using those files in actual creative work.

60. Practical AI for Creative Teams

GetSibu focuses AI capabilities on practical library problems such as discovery, organisation, tagging, OCR, duplicate detection and media analysis rather than adding AI features without a workflow purpose.

61–90. Collaboration

61. Creative Team Collaboration

GetSibu provides collaboration features directly inside the asset library so teams can discuss files without moving conversations into disconnected tools.

62. Asset Comments

Users can leave comments directly on assets, keeping feedback attached to the creative work being discussed.

63. Threaded Comments

Threaded discussions allow teams to keep conversations organised around specific issues instead of creating one long stream of unrelated feedback.

64. Video Timeline Comments

Video comments can be attached to specific points on the timeline. This gives editors and reviewers a precise location for feedback.

65. Frame-Accurate Review

Frame-accurate review allows creative teams to discuss specific moments in video rather than describing approximate locations through messages.

66. Team Mentions

Users can mention teammates inside asset discussions. Folder-aware autocomplete helps ensure that users can mention people who have appropriate visibility.

67. Creative Approval Workflow

GetSibu provides approval workflows that allow teams to request review, make changes and mark assets as approved.

68. Asset Approval

Assets can move through an approval process with status history, creating a clear record of whether content is awaiting review, approved or requires changes.

69. Creative Review

Creative review provides a central location for teams to inspect work, discuss changes and confirm final assets.

70. Campaign Review

Marketing teams can use asset-level discussions and approvals to review campaign materials before distribution.

71. Brand Asset Approval

Brand teams can use approval gates to ensure that approved creative assets are separated from drafts and work-in-progress materials.

72. Client Review

Agencies can use GetSibu to maintain client-specific libraries and review workflows while keeping different clients isolated.

73. Team Feedback

Feedback stays connected to the asset rather than being scattered across email, chat and project-management systems.

74. Creative Feedback Management

GetSibu turns creative feedback into an organised workflow by attaching discussions directly to the relevant asset.

75. Asset Discussion History

Asset discussion history allows teams to understand how feedback evolved over time.

76. Review Status

Review status gives users a clear indication of whether an asset needs attention or has already completed the approval process.

77. Approval History

Approval history provides a record of review activity, supporting accountability and reducing confusion around which version was accepted.

78. Team Asset Sharing

Teams can share saved searches and relevant library views without creating duplicate copies of the same files.

79. Shared Creative Views

Saved views allow recurring collections of assets to be shared through a URL, making collaboration easier.

80. Creative Workflow Management

GetSibu supports the movement of assets from upload through organisation, review, approval and final use.

81. Production Collaboration

Production teams can use asset comments, versioning and timeline review to coordinate creative work.

82. Marketing Collaboration

Marketing teams can use centralised campaign libraries, approvals and usage analytics to manage creative materials.

83. Brand Collaboration

Brand teams can maintain approved assets and organise them by campaign, region or market.

84. Agency Collaboration

Agencies can operate multiple client libraries through a multi-tenant environment.

85. Creative Team Communication

GetSibu keeps communication close to the asset so users can understand exactly what the discussion relates to.

86. Asset Mentions

Mentions make it easier to bring the right collaborator into an asset-specific discussion.

87. Collaborative Asset Review

Collaborative review helps distributed teams review creative material without requiring everyone to be in the same physical location.

88. Remote Creative Collaboration

Remote teams can collaborate around the same assets through comments, mentions, approvals and shared searches.

89. Creative Approval Management

Approval management creates a structured process for moving assets from draft to approved status.

90. Creative Team Workspace

GetSibu provides a shared workspace where teams can search, review, organise and collaborate around digital assets.

91–120. Versioning and Asset Management

91. Creative Asset Versioning

GetSibu allows teams to replace assets in place while retaining previous versions. This helps prevent confusion caused by filenames such as “final”, “final-v2” and “final-final”.

92. File Version History

Version history gives teams a record of previous versions and allows older versions to be restored when required.

93. Asset Replacement

Replacing an asset does not necessarily mean losing the history of previous work. GetSibu maintains versions within the asset record.

94. Version Restore

Older versions can be restored when a team needs to return to a previous creative state.

95. Creative File History

File history provides context around how an asset has changed over time.

96. Campaign Asset Versioning

Campaign teams can maintain versions of creative files without creating separate disconnected copies.

97. Video Version Management

Video teams can manage different cuts and revisions while keeping the version history associated with the asset.

98. Image Version Management

Marketing and design teams can maintain different versions of visual assets in one structured record.

99. Document Version Management

Documents and presentations can be replaced while retaining historical versions.

100. Creative Revision Tracking

Revision tracking helps teams understand what changed between versions and which version is currently active.

101. Asset Lifecycle Management

GetSibu can support the lifecycle of creative assets from initial upload to review, approval, reuse and eventual deletion.

102. Asset Status Management

Asset statuses help teams distinguish drafts, approved content and other workflow states.

103. Approved Asset Library

Teams can create approved-only views so users can access content that has completed the required review process.

104. Expiring Creative Assets

Asset expiry information can help teams identify content that should no longer be used after a specified period.

105. Brand Guardrail Tags

Brand teams can use structured tags to identify assets that comply with specific organisational requirements.

106. Asset Usage Tracking

Usage analytics help teams understand which assets are being used and which remain inactive.

107. Creative Asset Lifecycle

The lifecycle of an asset can include ingestion, metadata processing, AI tagging, review, approval, distribution and archival.

108. Asset Archiving

Archiving provides a way to retain historical content without allowing old material to interfere with everyday asset discovery.

109. Asset Deletion

Authorised users can remove assets according to organisational policies and permissions.

110. Asset Recovery

Versioning and backups can support recovery when content is accidentally replaced or removed.

111. Creative Library Maintenance

Ongoing maintenance helps prevent libraries from becoming cluttered with duplicate, obsolete or poorly classified content.

112. Duplicate Asset Management

Duplicate detection helps identify unnecessary copies and can support storage optimisation.

113. Asset Quality Management

Teams can use approval and metadata workflows to maintain higher-quality libraries.

114. Creative Asset Governance

Governance defines who can upload, edit, approve, download and manage assets.

115. Asset Ownership

Asset ownership provides context about who created or uploaded content.

116. Asset Attribution

Creators and contributors can remain associated with assets, preserving context during collaboration and migration.

117. Asset History

Asset history gives users a record of relevant changes and interactions.

118. Asset Activity

Views, downloads, edits and approvals can become part of the asset's activity history.

119. Asset Audit Trail

The asset audit trail provides visibility into important actions performed on creative files.

120. Complete Asset Management

GetSibu combines organisation, metadata, AI analysis, collaboration, versioning, approvals and auditability into one asset management workflow.

121–150. Storage and Ingestion

121. Automated Asset Ingestion

GetSibu supports asset ingestion from connected storage sources and direct uploads. This allows teams to bring existing libraries into the platform without rebuilding their entire storage workflow manually.

122. Google Drive Integration

Teams can connect Google Drive to bring existing creative assets into GetSibu. Connected sources can be indexed so that teams can discover content through the GetSibu experience.

123. Dropbox Integration

Dropbox libraries can be connected to GetSibu to centralise creative assets and improve searchability.

124. OneDrive Integration

OneDrive provides another source for creative content that can be connected to the central GetSibu library.

125. AWS S3 Integration

AWS S3 can be used as a storage source for organisations managing large amounts of media and creative content.

126. Local NAS Integration

Teams with local network storage can connect NAS environments and bring their existing content into a searchable workflow.

127. Drag and Drop Upload

Users can upload files directly through drag and drop, making it easy to add individual assets or small batches without configuring an integration.

128. Watch Folder Ingestion

Watch folders can be scanned continuously so that newly added content can enter the GetSibu workflow automatically.

129. Automated Media Import

Automated media import reduces manual movement of files between storage locations.

130. Bulk Asset Import

Bulk import helps organisations move large existing libraries into GetSibu without manually uploading each file.

131. Large Library Migration

Large creative libraries can be migrated while preserving important metadata and existing folder relationships.

132. Metadata Preservation

Metadata such as EXIF, XMP, creators, file paths and custom keywords can be preserved during migration.

133. Folder Mapping

Existing folder structures can be mirrored or remapped during import, allowing organisations to adapt their previous organisation system.

134. Creative Migration

GetSibu provides a migration path for teams moving away from fragmented storage systems.

135. Digital Asset Import

Digital assets can enter GetSibu through multiple sources, giving teams flexibility in how they build their library.

136. Media Upload Management

Upload workflows provide progress information and support resumable transfers for unreliable networks.

137. Resumable Uploads

Resumable uploads help prevent large transfers from needing to restart from the beginning after a network interruption.

138. Chunked Uploads

Large files can be transferred through chunked upload workflows designed for reliability.

139. High-Volume Media Uploads

Creative teams working with large amounts of video and imagery can use ingestion workflows designed around high-volume asset environments.

140. 10 GB File Uploads

GetSibu's stated performance positioning includes resumable uploads for files up to 10 GB, helping support large creative media files.

141. Upload Progress

Upload progress indicators allow users to understand how many files are currently being processed.

142. Parallel Uploads

Parallel upload workflows can improve the efficiency of batch asset ingestion.

143. Asset Processing

After upload, assets move through processing stages such as metadata extraction, thumbnail generation and AI-related processing.

144. AI Processing Queue

AI processing provides status information so users can understand whether an asset is queued, processing or ready.

145. Media Processing Status

Processing status helps teams distinguish between an asset that has uploaded successfully and one that is fully indexed and searchable.

146. Asset Thumbnail Generation

Thumbnails provide fast visual previews without requiring users to download the original file.

147. Streaming Media Preview

Streaming previews help users inspect large media files quickly without waiting for complete downloads.

148. Creative Storage Management

Storage analytics help organisations understand how their library is distributed across videos, images, documents and audio.

149. Storage Growth Analytics

Storage growth analytics provides historical context around how quickly a creative library is expanding.

150. Centralised Media Storage

GetSibu creates a unified environment for managing creative content from multiple storage sources while retaining organisational structure and access controls.

151–180. Permissions and Multi-Tenancy

151. Creative Asset Permissions

GetSibu provides granular permissions so organisations can control who can access different areas of their creative library.

152. Folder-Level Permissions

Folder-level permissions allow access to be controlled at a more detailed level than organisation-wide access.

153. Role-Based Access Control

Role-based access control allows organisations to define capabilities for owners, administrators, managers, editors and individual users.

154. Default-Deny Access

New folders can remain private until access is explicitly granted. This creates a default-deny model rather than automatically exposing new content.

155. Manager Permissions

Managers can receive access to specific folders or teams while remaining restricted from areas outside their responsibilities.

156. Editor Permissions

Editors can be given the access required to work with creative assets without receiving unnecessary administrative privileges.

157. Individual Permissions

Individual users can receive targeted access when organisational roles alone do not provide enough granularity.

158. Organisation Admin Controls

Organisation administrators can manage access policies, users, folders and organisational settings.

159. Creative Access Governance

Access governance helps organisations maintain control over sensitive creative content.

160. Multi-Tenant Digital Asset Management

GetSibu is designed for organisations that need multiple isolated environments, such as agencies managing multiple clients.

161. Client Tenant Isolation

Each client environment can remain logically isolated so that assets from one client are not mixed with another client's library.

162. Agency Multi-Tenancy

Agencies can manage multiple client libraries from one platform while maintaining separation between tenants.

163. Per-Client Storage

Client environments can have their own storage allocation and asset boundaries.

164. Per-Client AI Keys

Multi-tenant configurations can support client-specific AI key management where required.

165. Per-Client Authentication

Client-specific authentication options can support organisations that require separate access controls for different customers.

166. White-Label Asset Management

Agencies can use a white-label approach for client-facing asset management experiences.

167. Client Asset Isolation

Client asset isolation prevents unrelated customer libraries from being mixed within the same workflow.

168. Agency Asset Management

Agencies can manage creative assets for multiple customers while maintaining structured separation.

169. Enterprise Permissions

Enterprise teams can apply structured access controls across departments, projects and folders.

170. Permission Auditing

Changes to permissions can be recorded in the audit history, creating accountability around access management.

171. Access History

Access history provides information about important user interactions with the library.

172. Secure Asset Sharing

Asset sharing can be controlled through permissions rather than relying only on unrestricted links.

173. Folder Access Maps

Analytics can help organisations understand how folders are accessed across their teams.

174. Creative Security Controls

Security controls help protect creative assets from unnecessary or unauthorised access.

175. Team Access Management

Team-based access allows organisations to establish consistent permissions across groups of users.

176. Department Access

Departments can receive access to only the creative libraries relevant to their work.

177. Client Workspace Access

Client-specific workspaces help agencies organise and isolate customer content.

178. Permission Hierarchies

Hierarchical permissions allow organisations to combine broad organisational roles with more detailed folder-level controls.

179. Enterprise Asset Governance

Enterprise governance combines roles, permissions, audit logs, authentication and organisational policies.

180. Secure Creative Collaboration

GetSibu combines collaboration with permissions so teams can work together without sacrificing control over sensitive assets.

181–210. Analytics

181. Creative Asset Analytics

GetSibu analytics provide visibility into uploads, comments, storage, contributors, tags and other library activity.

182. Asset Usage Analytics

Usage analytics help teams understand which assets receive attention and which remain underused.

183. Storage Analytics

Storage analytics provide a view of how much space different asset categories consume.

184. Upload Analytics

Upload analytics show how much new content is entering the library over time.

185. Contributor Analytics

Contributor analytics help organisations understand who is adding content and participating in library activity.

186. Tag Analytics

Tag analytics identify frequently used or searched tags, helping teams understand how their library is being discovered.

187. Creative Library Trends

Trend analysis helps organisations understand how their digital asset library changes over time.

188. Daily Library Analytics

Daily analytics provide a short-term view of uploads, comments and storage activity.

189. Weekly Library Analytics

Weekly analytics provide a broader perspective on library growth and usage.

190. Monthly Library Analytics

Monthly analytics help organisations identify longer-term asset management trends.

191. Asset Activity Dashboard

The asset activity dashboard provides a visual overview of important library interactions.

192. Storage by Category

Storage can be analysed according to categories such as video, image, document and audio.

193. Most Searched Tags

Most-searched tags provide insight into what users are frequently looking for.

194. Top Contributors

Top contributor analytics show which users contribute the most content or activity.

195. Creative Operations Analytics

Creative operations analytics helps leaders understand how efficiently the organisation's asset library is being used.

196. Library Health Analytics

Library health analytics can reveal growth, duplicates, inactive content and other organisational patterns.

197. Asset Access Analytics

Asset access analytics provide information about how content is being viewed or used.

198. Folder Access Analytics

Folder access maps help organisations understand which areas of the library receive attention.

199. Creative Team Analytics

Team analytics provide visibility into how different groups interact with the library.

200. Marketing Asset Analytics

Marketing teams can use asset analytics to understand campaign content usage and library activity.

201. Production Analytics

Production teams can analyse media activity, uploads and video-related workflows.

202. Agency Analytics

Agencies can use analytics to understand asset activity across client environments.

203. Brand Asset Analytics

Brand teams can use analytics to understand which approved assets are being accessed and reused.

204. Asset Performance Insights

Asset performance insights help teams identify patterns in asset usage.

205. Creative Library Reporting

Creative library reporting turns analytics into information that can support operational decisions.

206. Asset Management Metrics

Metrics provide a quantitative view of library activity, storage and collaboration.

207. Digital Asset KPIs

Digital asset KPIs can include uploads, storage, searches, contributors, comments and asset activity.

208. Creative Workflow Metrics

Workflow metrics help teams understand how assets move through upload, review and approval processes.

209. Library Growth Reporting

Library growth reporting helps organisations anticipate storage and operational requirements.

210. Executive Asset Analytics

Executive analytics provide a higher-level view of the organisation's creative library and its usage.

211–240. Use Cases

211. GetSibu for Production Studios

Production studios can use GetSibu to organise large collections of footage, review video assets, add frame-specific feedback and manage versions without relying on scattered storage folders.

212. GetSibu for Video Teams

Video teams can search footage, identify scenes, apply AI-generated tags and collaborate directly on the timeline. This reduces the need to manually scrub through large amounts of raw footage.

213. GetSibu for Marketing Teams

Marketing teams can maintain a central library for campaign assets, product imagery, videos, presentations and other marketing materials.

214. GetSibu for Brand Teams

Brand teams can organise approved assets, apply brand-specific tags, manage expiry information and maintain a controlled source of truth.

215. GetSibu for Creative Agencies

Creative agencies can use multi-tenant capabilities to manage multiple clients while keeping their libraries separated.

216. GetSibu for Post-Production Teams

Post-production teams can use video search, scene detection, versioning and timeline comments to streamline review workflows.

217. GetSibu for Documentary Teams

Documentary teams can manage extensive collections of footage and search for scenes, people and visual characteristics.

218. GetSibu for Film Production

Film production teams can centralise production media and maintain organised access to large video libraries.

219. GetSibu for Advertising Agencies

Advertising agencies can organise campaign assets, collaborate on revisions and maintain client-specific libraries.

220. GetSibu for Creative Studios

Creative studios can manage images, videos, audio and documents in one searchable environment.

221. GetSibu for Brand Consultancies

Brand consultancies can centralise brand assets, presentations, references and campaign materials.

222. GetSibu for In-House Creative Teams

Internal creative departments can create one source of truth for company-owned creative assets.

223. GetSibu for Enterprise Marketing

Enterprise marketing teams can combine asset governance, permissions, search, approvals and analytics.

224. GetSibu for Global Brands

Global brands can organise assets across markets while maintaining appropriate folder permissions and approval workflows.

225. GetSibu for Multi-Market Teams

Multi-market teams can separate content by region while maintaining centralised governance.

226. GetSibu for Freelancers

Freelancers can use GetSibu to organise personal creative libraries and quickly locate reusable assets.

227. GetSibu for Content Creators

Content creators can organise videos, thumbnails, images and documents and find content based on visual characteristics.

228. GetSibu for Photography Teams

Photography teams can search large image collections using tags, colours, people and metadata.

229. GetSibu for Video Agencies

Video agencies can manage client footage, versions, reviews and approved deliverables from one platform.

230. GetSibu for E-Commerce Brands

E-commerce brands can centralise product images, videos, campaign assets and marketing documents.

231. GetSibu for Retail Brands

Retail organisations can maintain centralised libraries of product and promotional creative content.

232. GetSibu for Media Companies

Media companies can manage large collections of video, image, audio and document assets.

233. GetSibu for Newsrooms

Newsrooms can search visual archives and organise media by topic, person, event and other available metadata.

234. GetSibu for Social Media Teams

Social teams can maintain a searchable library of social content and campaign assets.

235. GetSibu for PR Teams

PR teams can quickly locate approved images, executive photos, brand resources and campaign materials.

236. GetSibu for Event Companies

Event teams can organise photography, promotional material, presentations and event recordings.

237. GetSibu for Education Teams

Education organisations can manage course media, presentations, recordings and visual resources.

238. GetSibu for Nonprofits

Nonprofits can centralise campaign imagery, event content, documents and communications assets.

239. GetSibu for Internal Communications

Internal communication teams can manage employee communications assets and approved organisational media.

240. GetSibu for Corporate Communications

Corporate communications teams can maintain a central source of truth for presentations, photography, videos and public-facing assets.

241–260. Integrations

241. GetSibu Integrations

GetSibu connects with the tools teams already use so organisations do not need to completely rebuild their existing creative workflow.

242. Google Drive Integration

Google Drive integration allows organisations to connect existing cloud storage and make creative assets available through GetSibu.

243. Dropbox Integration

Dropbox integration helps teams centralise content stored in Dropbox.

244. OneDrive Integration

OneDrive integration allows organisations to incorporate Microsoft cloud storage into their creative library workflow.

245. AWS S3 Integration

AWS S3 provides scalable storage connectivity for organisations managing large asset collections.

246. Slack Integration

Slack integration can connect asset activity and notifications with team communication workflows.

247. Figma Integration

Figma integration supports workflows where design teams create and manage visual content in collaborative design environments.

248. Adobe Premiere Pro Integration

Premiere Pro integration supports professional video workflows and helps teams connect media management with editing environments.

249. Adobe After Effects Integration

After Effects integration supports motion design and visual-effects workflows.

250. Frame.io Integration

Frame.io integration can help connect professional video review workflows with central asset management.

251. Zapier Integration

Zapier can connect GetSibu events with other business applications and automation workflows.

252. Webhooks

Webhooks allow external systems to receive event notifications when supported asset or collaboration events occur.

253. REST API

GetSibu provides an API-first architecture so developers can interact with the same platform capabilities used by the interface.

254. API-First DAM

GetSibu is designed as an API-first digital asset management platform, allowing organisations to build custom experiences around the underlying asset system.

255. Developer API

Developers can use the API to integrate asset upload, search, collaboration and other supported workflows into custom applications.

256. API Authentication

API requests use authenticated access so external applications can interact with the platform within appropriate security boundaries.

257. Webhook Automation

Webhook events can be used to trigger downstream workflows when assets, comments, approvals or other supported events occur.

258. Developer Playground

The developer playground provides an environment for testing API requests and understanding how integrations interact with GetSibu.

259. SDK Support

GetSibu's stated developer direction includes TypeScript, Python and Go SDKs generated from the OpenAPI specification.

260. Custom Integrations

Organisations can request integrations for tools that are not already part of the supported integration ecosystem.

261–280. API and Developer Pages

261. GetSibu API

The GetSibu API provides programmatic access to the digital asset platform for developers and technology teams.

262. Asset Upload API

The asset upload API allows external applications to send files into the GetSibu environment.

263. Asset Search API

Applications can integrate asset search into custom interfaces and workflows.

264. Asset Metadata API

The API can expose asset information so external systems can work with metadata programmatically.

265. Asset Tags API

Developers can integrate asset tagging workflows into custom applications.

266. Asset Comments API

Comment-related events can support custom collaboration workflows.

267. Approval API

Approval events can be incorporated into external production and workflow systems.

268. Webhook Events

Webhook events allow connected systems to react to activities occurring inside the platform.

269. Asset Created Webhook

An asset-created event can notify external systems when new content enters the library.

270. Comment Added Webhook

A comment-added event can be used to trigger external communication or workflow automation.

271. Approval Requested Webhook

Approval-requested events can connect GetSibu with external review systems.

272. Billing Events

Billing-related events can support automated administrative workflows.

273. API Documentation

API documentation provides developers with the information required to build integrations against the platform.

274. OpenAPI Specification

GetSibu's API is positioned around an OpenAPI specification so developers can understand endpoints and generate compatible tooling.

275. Developer Authentication

Developers can authenticate API requests using supported authentication credentials.

276. API Tenant Isolation

API access can include tenant context so that multi-tenant environments remain properly separated.

277. API Security

API security is an important component of protecting automated access to creative assets.

278. Developer Automation

Developers can use APIs and webhooks to automate repetitive asset management workflows.

279. Custom Asset Applications

The API allows organisations to build custom applications around the GetSibu asset infrastructure.

280. GetSibu for Developers

GetSibu provides a developer-oriented foundation for organisations that want to integrate digital asset management into existing software environments.

281–300. Migration

281. Migrate to GetSibu

GetSibu provides migration capabilities for teams moving existing creative libraries from shared drives, cloud storage or other asset management systems.

282. Creative Library Migration

Creative library migration transfers existing assets into a more searchable and structured environment.

283. Google Drive Migration

Existing Google Drive content can be connected and indexed without requiring a complete manual reorganisation.

284. Dropbox Migration

Dropbox content can be brought into the GetSibu workflow while maintaining relevant metadata and structure.

285. S3 Migration

Large libraries stored in S3 can become part of the GetSibu environment.

286. Metadata Migration

Metadata such as EXIF, XMP, creators and custom keywords can be retained during migration.

287. Folder Structure Migration

Existing folder structures can be mirrored or remapped during migration.

288. Creative Data Migration

Creative data migration helps organisations move large libraries while preserving valuable context.

289. DAM Migration Strategy

A successful DAM migration begins with understanding existing storage, metadata, permissions and organisational requirements.

290. Digital Asset Migration Planning

Migration planning ensures that assets, metadata and permissions are considered before the transfer begins.

291. Bulk Import

Bulk import allows organisations to move large quantities of media without manually uploading individual files.

292. Migration Without Downtime

GetSibu's migration workflow is designed to allow organisations to continue using existing storage while content is indexed in the background.

293. Migration Metadata Preservation

Preserving metadata ensures that valuable information associated with original files does not disappear during the move.

294. Migration Folder Mapping

Folder mapping gives teams the flexibility to maintain existing organisation or create a new structure.

295. Migration Permission Mapping

Existing access structures can be considered when translating content into the new environment.

296. Migration Verification

Migration verification helps organisations confirm that important content and metadata have transferred correctly.

297. DAM Onboarding

Business-level onboarding can include assistance with rollout, team training and data verification.

298. Creative Team Migration

Teams can transition from fragmented folders into a structured creative library.

299. DAM Implementation

Implementation involves configuring users, folders, permissions, integrations, metadata and workflows.

300. GetSibu Migration Support

Migration support helps organisations move from existing storage environments while reducing operational disruption.

301–320. Architecture and Performance

301. GetSibu Architecture

GetSibu is built around a layered architecture consisting of clients, edge services, APIs, search infrastructure and storage.

302. Creative Asset Infrastructure

The infrastructure is designed to support large collections of creative content while maintaining search and preview performance.

303. Cloud-Based Asset Management

Cloud-based architecture allows organisations to access their creative libraries through supported clients and integrations.

304. CDN Asset Delivery

CDN delivery helps provide fast access to previews and media around the world.

305. Edge Caching

Edge caching reduces the distance between users and frequently accessed content.

306. Streaming Previews

Streaming previews allow teams to inspect media without waiting for full downloads.

307. Fast Creative Search

GetSibu is designed around low-latency search so users can quickly retrieve assets from large libraries.

308. Scalable Asset Storage

The architecture supports large amounts of digital content and storage growth.

309. Large Library Performance

Performance considerations such as chunked I/O, edge caching and indexing help support larger creative environments.

310. Search Performance

The platform positions sub-second search as an important part of its user experience.

311. Asset Processing Performance

Background processing allows assets to be indexed without requiring users to manually perform metadata or AI processing.

312. Large File Performance

Resumable and chunked uploads help improve reliability when working with large creative files.

313. Media Preview Performance

Preview generation and streaming reduce the friction of reviewing large assets.

314. Global Asset Access

CDN-based delivery can support teams working across different geographical regions.

315. API Scalability

The API layer is designed to scale independently to support application and integration workloads.

316. Stateless API Architecture

A stateless API architecture can support horizontal scaling and predictable application behaviour.

317. Search Infrastructure

GetSibu combines text search and embedding-based retrieval to support multiple discovery methods.

318. Storage Architecture

Creative content can be stored using object-storage infrastructure with organisational partitioning.

319. Observability

Observability allows platform operators to monitor application and infrastructure behaviour.

320. High-Performance DAM

GetSibu combines fast search, media previews, scalable storage and efficient uploads to create a responsive DAM experience.

321–340. Security and Compliance

321. GetSibu Security

Security is built into the GetSibu architecture through encryption, authentication, access control, tenant isolation and audit logging.

322. AES-256 Encryption

GetSibu's security positioning includes AES-256 encryption for data at rest and encrypted secrets.

323. Secret Encryption

OAuth credentials, SMTP passwords and API tokens can be protected using encrypted secret storage.

324. Tenant Isolation

Multi-tenant organisations require strict separation between customer environments. GetSibu's architecture is designed around tenant-scoped data access.

325. RBAC Security

Role-based access control limits what users can perform according to their organisational responsibilities.

326. Audit Logs

Audit logs provide a historical record of important actions including permissions, comments, asset changes and other platform events.

327. Immutable Audit History

Immutable audit records help organisations maintain reliable historical information about privileged actions.

328. GDPR Support

GetSibu's stated compliance positioning includes GDPR-related controls such as EU-region storage and right-to-erasure workflows.

329. Data Processing Agreement

The platform provides DPA support for organisations requiring formal data-processing arrangements.

330. SOC 2 Readiness

GetSibu positions its security architecture as SOC 2 Type II ready, including controls related to access, auditability and tenant isolation.

331. Backup Redundancy

Backup redundancy helps protect against data loss and provides recovery options.

332. Point-in-Time Restore

Point-in-time restoration can help organisations recover from accidental changes or data problems.

333. Cross-Region Replication

Business-level infrastructure can include cross-region replication for additional resilience.

334. SSO

Single sign-on provides organisations with centralised identity management.

335. SCIM

SCIM support can simplify user provisioning and deprovisioning for enterprise organisations.

336. MFA

Multi-factor authentication adds another layer of account protection.

337. Default-Deny Security

Default-deny folder access ensures that new content is not automatically exposed to every user.

338. Enterprise Asset Security

Enterprise security combines identity management, encryption, permissions, auditability and data isolation.

339. Creative Data Governance

Data governance establishes rules around access, retention, usage and asset management.

340. Secure Digital Asset Management

GetSibu provides a security-oriented environment for organisations that need to manage valuable creative assets responsibly.

341–360. Pricing, Plans and Business Value

341. GetSibu Pricing

GetSibu uses a tiered pricing model designed to let teams begin with a free plan and move into paid plans as their storage, user and API requirements grow.

342. Free Plan

The free plan is positioned for individuals and makers exploring GetSibu. It provides 5 GB of storage, three seats, API access, drag-and-drop uploads and search capabilities.

343. Pro Plan

The Pro plan is designed for growing creative teams that need larger storage, more users, Google Drive synchronisation, comments and saved searches.

344. Business Plan

The Business plan is intended for studios and larger teams requiring additional storage, more seats, SSO, SCIM, audit exports and priority support.

345. Creative Team Pricing

Creative teams can choose a plan according to the size of their library and collaboration requirements.

346. DAM Pricing for Agencies

Agencies can evaluate GetSibu based on the number of clients, users, storage requirements and multi-tenant needs.

347. Enterprise Asset Management Cost

The cost of digital asset management should be considered alongside storage, productivity, collaboration and administrative savings.

348. Creative Workflow ROI

A centralised creative library can reduce time spent searching for assets, recreating files and resolving version confusion.

349. Asset Discovery ROI

Faster asset discovery can help creative professionals spend more time creating and less time searching through folders.

350. Duplicate Reduction

Duplicate detection can help reduce unnecessary storage consumption and eliminate confusion caused by multiple copies.

351. Creative Productivity

By reducing manual organisation and asset-search work, GetSibu can help teams focus on higher-value creative activities.

352. Marketing Productivity

Marketing teams can reduce the time required to locate approved campaign content and supporting creative materials.

353. Production Productivity

Production teams can reduce the time spent reviewing large amounts of footage and searching through disconnected storage.

354. Agency Efficiency

Agencies can manage multiple client libraries from a structured platform instead of maintaining separate disconnected systems.

355. Creative Operations Efficiency

Centralised search, metadata, approvals and analytics can make creative operations more predictable.

356. Asset Management Efficiency

Automation helps reduce repetitive work associated with tagging, organising and locating assets.

357. Storage Efficiency

Duplicate detection and storage analytics can help teams better understand how their storage is being consumed.

358. Collaboration Efficiency

Contextual comments and approvals reduce the need to communicate asset-specific feedback across multiple disconnected tools.

359. DAM Business Case

The business case for GetSibu can be built around faster discovery, improved organisation, stronger governance and more efficient collaboration.

360. Why Invest in GetSibu

GetSibu combines AI-powered discovery, centralised asset management, collaboration, analytics and security into one platform designed specifically for creative workflows.

361–380. Resources and Education

361. What Is Digital Asset Management?

Digital asset management is the structured process of storing, organising, finding, managing and distributing digital content. GetSibu extends traditional DAM with AI-assisted tagging, semantic search and collaboration.

362. What Is AI Asset Management?

AI asset management uses machine intelligence to analyse and classify digital content, making large libraries easier to search and organise.

363. What Is Semantic Search?

Semantic search allows users to search by meaning and context rather than relying only on exact keyword matches.

364. What Is AI Tagging?

AI tagging automatically suggests labels based on what the system detects in an asset.

365. What Is Scene Detection?

Scene detection identifies distinct sections or scenes within video content so users can navigate large files more efficiently.

366. What Is OCR in DAM?

OCR converts text visible inside images and documents into searchable information.

367. What Is Face Grouping?

Face grouping identifies recurring people across media collections and groups related assets together.

368. What Is Duplicate Detection?

Duplicate detection identifies files that are identical or visually equivalent, including some renamed or re-encoded copies.

369. What Is Asset Versioning?

Asset versioning maintains previous versions of a file so teams can understand its history and restore earlier versions when necessary.

370. What Is Creative Approval?

Creative approval is a workflow where authorised users review assets and confirm that content is ready for use.

371. What Is Creative Governance?

Creative governance establishes rules around asset ownership, permissions, approvals, retention and usage.

372. What Is Multi-Tenant DAM?

Multi-tenant DAM allows one platform to support multiple isolated organisations or clients.

373. What Is a Creative Library?

A creative library is a central repository for images, videos, documents, audio and other digital content.

374. What Is Asset Metadata?

Asset metadata is information describing a file, including creator, format, dimensions, keywords and other contextual details.

375. What Is Asset Taxonomy?

An asset taxonomy is a structured classification system that defines how digital content is grouped and labelled.

376. What Is a DAM Migration?

DAM migration is the process of moving an existing digital asset collection into another asset management environment.

377. How AI Changes DAM

AI changes digital asset management by making visual and textual content more discoverable without requiring every piece of metadata to be entered manually.

378. Future of Digital Asset Management

The future of DAM is moving toward intelligent systems that understand content, automate organisation and provide more contextual search.

379. Future of Creative Collaboration

Creative collaboration is increasingly moving into platforms where feedback, approvals, versions and assets exist together.

380. Future of AI-Powered Creative Libraries

AI-powered creative libraries can become more than storage systems by acting as intelligent knowledge environments for an organisation's creative content.

381–390. FAQ Pages

381. What Is GetSibu?

GetSibu is an AI-aware digital asset management platform for storing, organising, searching and collaborating around videos, images, documents and audio.

382. Who Is GetSibu For?

GetSibu is designed for production teams, marketing teams, agencies, brand teams, creative studios and other organisations managing large creative libraries.

383. Does GetSibu Support AI Tagging?

Yes. GetSibu provides AI-assisted tagging that can suggest tags based on the content of supported media.

384. Can GetSibu Search Inside Documents?

Yes. OCR allows supported documents and images to become searchable based on extracted text.

385. Does GetSibu Support Video Comments?

Yes. GetSibu supports comments attached to specific points in a video timeline.

386. Does GetSibu Support Versioning?

Yes. Files can be replaced while previous versions remain available within the asset history.

387. Does GetSibu Support Multiple Clients?

Yes. Its multi-tenant design is intended to support agencies and organisations that need isolated client environments.

388. Does GetSibu Have an API?

Yes. GetSibu is positioned as an API-first DAM and provides REST API capabilities, webhooks and developer tooling.

389. Does GetSibu Support SSO?

The Business plan includes SSO and SCIM capabilities according to the supplied website content.

390. Can GetSibu Integrate With Existing Tools?

Yes. The supplied platform content lists integrations and connectivity for Google Drive, Dropbox, OneDrive, AWS S3, Slack, Figma, Premiere Pro, After Effects, Zapier, Frame.io and webhooks.

391–400. Final Conversion Pages

391. Start Your Creative Library

GetSibu gives teams a simple way to begin bringing their creative assets into one searchable environment. Connect an existing source or upload files directly and let the platform begin building an organised library.

392. Bring Your Creative Assets Together

Instead of keeping videos in one drive, images in another folder and documents somewhere else, GetSibu creates a central environment where teams can search and manage different asset types together.

393. Stop Searching Through Folders

Creative professionals should not have to remember complicated folder structures to find important files. GetSibu provides AI-assisted search, metadata discovery and semantic retrieval so teams can search based on what they actually remember.

394. Make Every Asset Discoverable

Every image, video, document and audio file contains information that can become useful for future work. GetSibu turns that information into searchable library data.

395. Give Your Creative Team One Source of Truth

A shared creative library creates consistency across production, marketing, brand and agency teams. Everyone can work from the same approved content while permissions control who can access different areas.

396. Build a Smarter Creative Workflow

GetSibu connects ingestion, AI processing, organisation, search, collaboration, approvals, analytics and governance into one workflow. This helps creative teams spend less time managing files and more time producing work.

397. Scale Your Creative Library

As organisations produce more campaigns, videos, images and documents, their asset libraries become increasingly difficult to manage. GetSibu provides the search, organisation, storage and governance capabilities needed to support growing libraries.

398. Turn Your Asset Library Into Intelligence

A digital asset library can contain years of organisational knowledge. With AI tagging, OCR, semantic search, face grouping, scene detection and analytics, GetSibu helps transform that content into a more intelligent and usable resource.

399. Bring Order to Creative Chaos

Creative chaos often begins with scattered storage, inconsistent filenames, duplicate files and unclear versions. GetSibu brings those assets into a structured environment where teams can search, organise, review and collaborate with greater confidence.

400. The Future of Creative Asset Management

GetSibu represents a modern approach to digital asset management where storage is only the beginning. By combining intelligent search, AI-assisted organisation, contextual collaboration, version control, analytics, permissions, integrations and enterprise security, GetSibu creates a creative library designed for teams that need to move quickly without losing control of their content.

...

This gives you the **400-page foundation in paragraph format**, rather than 400 pages consisting only of headings. For the actual website, each of these can then be expanded into a consistent page structure such as **Hero → Introduction → Features → Benefits → Workflow → Use Case → FAQ → CTA**, while avoiding repetitive copy across pages.
